                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present amino acid sequence is encoded by the endogenous plasmid Propionibacterium LMG 16545 ORF-1, derived from Propionibacterium freudenreichii deposited under CBS 101022 or CBS 101023. The vector has insertion sites for foreign DNA fragments and is capable of autonomous replication. It can be used safely as they remain extrachromosomal and are very stable. They can be used to express homologous or heterologous proteins, which may include antigens for use in vaccines, nutritional, growth and clotting factors, antimicrobials, vitamins (especially vitamin B12), enzymes, hormones and drugs. The Propionibacterium host cells are used in the production of animal feeds, manufacture of foodstuffs like, sausages and cheese, where they may be used instead of or in addition to lactic acid bacteria and in the manufacture of vitamin B12. The DNA sequence can also be used as a source of primers and probes.

This plasmid was used in the construction of a series of vectors used to produce the recombinant Mycobacteria of the invention. The recombinant mycobacteria of the invention. The recombinant mycobacteria of the invention are transformed with DNA encoding a polypeptide which comprises a lipoprotein secretion signal sequence and an antigen (Ag) heterologous to the mycobacteria. The lipoprotein secretion signal causes the Ag to be produced as a lipoprotein. The mycobacteria may be used in the form of a live bacterial vaccines against Lyme disease, where the bacteria express a surface protein of Borrella burgdorferi, the causative agent of Lyme disease. This sequence is printed in the specification in the C-terminal to N-terminal orientation as determined from the corresponding DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mycobacteria expressing secretion signal of lipoprotein and heterologous antigen, esp. outer surface protein A or B of Borrelia burgdorferi - are used in the form of a live bacterial vaccines

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     plasmid pYUB12 was constructed by ligating a 5kb Sau3 fragment from CD pAL5000 (contg. a replication origin from M.fortuitum) to BamHI-CD dispested pIJ666 (contg. an E.coli ori and kanamycin-neomycin resistance sequences). A 2566bp HpaI-EcoRV fragment from pYUB12 (comprising the minimum sequence necessary for plasmid replication in BCG) was ligated to PvuII-digested pYUB8 to form pYUB53. (Plasmid CD pYUB8 is a pBR322 deriv, which includes an E.coli replicon and a kanamycin resistance gene). Twelve restriction sites were removed by digesting pYUB53 with Aatl, EcoRV and PstI. To eliminate 792 chases of the (inactivated) tet gene, the plasmid was digested with CO warI and the 6407bp gel purified fragment was religated/CD the nucleotide sequence of plasmid pWI01 is printed in the specification but the copy quality is too poor to allow the specification but the copy quality is too poor to allow the squence to be included on the GENESEQ nucleotide database.

Three proteins are encoded by pWV101, i.e. the kanamycin resistance protein and proteins "d" and "e" encoded by the complementary contents also AAR20991 and AAR20993.
                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                 밁
                                                                                                  밁
                                                                                                                      Q
                                                                                                                                                                                                                   This sequence is the tet d gene product encoded by plasmid pMV101. When the nucleotide was decoded, the sequence in the specification was found to contain several deletions and insertions which upset the reading frame. Also many codons were found to encode amino acids contrary to the universal genetic code. In addition two amino acids in the sequence in the specification were given as X and were further defined.
                                                                                                                                                                                                                                                                                                                                                                       Expression vector for expressing protein or polypeptide in mycobacterium - conty DNA sequences encoding lipoprotein secretion signal and peptide heterologous to bacteria expressing fusion protein of lipoprotein heterologous to bacteria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cytotoxic T-lymphocyte response; transformed Mycobacteria; Mycobacterium smegmatis; vaccine; cell mediated immunity; I

These are useful for improving Coryneform bacteria, which are capable of growing at elevated temperatures and of producing substances such as L-amino acids. The present sequence is the rep protein from a Coryneform bacterial plasmid.

The present invention provides plasmids isolated from Corynebacterium thermoaminogenes encoding a rep protein. These are useful for improving Coryneform bacteria, which are capable of growing at elevated temperatures and of producing substances such as L-amino acids. The present sequence is the rep protein from a Coryneform bacterial plasmid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New plasmids derived from Corynebacterium thermoaminogenes, improving coryneform bacteria, which can grow at elevated t and for producing useful substances (e.g. L-amino acids)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides plasmids isolated from Corynebacterium thermoaminogenes encoding a rep protein. These are useful for improving Coryneform bacteria, which are capable of growing at elevated temperatures and of producing substances such as L-amino acids. The present sequence is the rep protein from a Coryneform bacterial plasm.

                                                                                                                   mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                      Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                            The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. I are useful for identifying the mutation point of a gene derived from
                                                                         Sequence
                                                                                                          European Patent Office.
                                                                                                                                                                                                                                                                                                                         Claim 17; SEQ ID NO: 4495; 246pp + Sequence Listing; English

                                                                                                                                                                                                                                                                                                                       The present invention relates to the cloning and sequencing of the cluster encoding a modular type I polyketide synthase (PKS) enzyme involved in the biosynthesis of the macrolide antibiotic nystatin. The nystatin PKS is useful as antifungal antibiotics. The present sequence is a transcriptional activator encoding Streptomyces nours nystatin gene, ORF2.

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

The invention relates to isolated polynucleotide (I) and collective (II) sequences. (I) is useful as hybridisation probes, complymerase chain reaction (PCR) primers, oligomers, and for chromosome and in recombinant production of (II). The collective are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating the polypeptide and polynucleotide sequences have applications in the polypeptide and polynucleotide sequences have applications in cut diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and camino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed septification, but was obtained in electronic format directly from WIPO at the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess blodyversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 20; SEQ ID No 59755; 103pp; English

37K protein - Mycobacterium fortuitum plasmid pAL5000 C;Species: Mycobacterium fortuitum C;Date: 31-Mar-1992 #sequence_revision 31-Mar-1992 #text_change 10-Dec-1999

C; Accession: JS0052;

R;Rauzier, J; Moniz-Pereira, J; Gicquel-Sanzey, B. Gene 71, 315-321, 1988
A;Title: Complete nucleotide sequence of pAL5000, a plasmid A;Reference number: JS0052; MUID:89138007
A;Accession: JS0052

from

Mycobacterium fortui

A; Molecule type: DNA A; Residues: 1-336 < RAU>

as

for e 18 residue as Trp

A; Note: the authors translated the initiation codon GTG for A; Note: the authors translated the codon ACA for residue: R; Labidi, A.; Mardis, E.; Roe, B.A.; Wallace Jr., R.J. Plasmid 27, 130-140, 1992

A; Title: Cloning and DNA sequence of the Mycobacterium for A; Reference number: JQ1440; MUID:92311251

A; Accession: JQ1440

A; Molecule type: DNA
A; Residues: 160-336 < LAB> fortuitum var fortuitum plasmi

A;Cross-references: GB:M60875; NID:g149984; PIDN:AAA25372.1; PID:g149985 A;Experimental source: var. fortuitum C;Genetics:

A; Genome: plasmid

C; Function: A; Start codon: GTG

A; Description: this protein is involved in the initiation of plasmid replication C; Superfamily: Mycobacterium hypothetical 37K protein

FUNCTION: MEMBER OF THE TWO-COMPONENT REGULATORY SYSTEM NTRB/NTRC INVOLVED IN THE ACTIVATION OF NITROGEN ASSIMILATORY GENES SUCH AS GLAA. NTRC IS PHOSPHORYLATED BY NTRB AND INTERACTS WITH SIGMA-54. SIMILARITY: CONTAINS 1 RESPONSE REGULATORY DOMAIN.

SIMILARITY: THE CENTRAL REGION CONTAINS A SIGMA-54 FACTOR INTERACTION ATP-BINDING DOMAIN.
                                                                                                                                                                                                                                                                                       DNA sequence of the Rhodobacter analogues required for nitrogen Gen.
